

Project Progress Report 2

I improved the website's appearance and feel by using the CSS and Java script I learned. I began by defining the layout and different aspects of the project's HTML structure. Styled the HTML elements with CSS, adjusting layout, color, and font to produce a visually pleasing and responsive design. To make sure the project is responsive and looks excellent on a range of devices and screen sizes, media queries were used in the CSS. Added eye-catching effects with CSS animations and transitions to increase the project's visual appeal and engagement. included JavaScript to provide the project dynamic behavior, boosting user interactions and elevating the user experience all around. JavaScript event listeners were used to record user input changes and clicks. JavaScript was used to implement the accordion and toggle features, which allow material to be shown or hidden in response to user input.
